Nepheline Syenite Order Form ‘Fine Print’ —

Definitions, Questions & Answers, Royalties Explanation:

1)Who? To do due diligence on the publishers of this © Purchase Order Form, read the [ECO-Mining-Milling.com](http://www.ECO-Mining-Milling.com) Limited Cooperative Association open Minute Book Operating Plan, reachable on request through “HomeOffice@ECO-Mining-Milling.com” and acquaint yourself with an PayPal accepted escrow account at [MacAndMurray@gmail](mailto:MacAndMurray@gmail.com) backed by www.MiningMagazines.com, as well as “TheProspector.com” reachable at “ProspectorBarryMurray@gmail.com”, which is the “Brand Name website of” BarryMurray.com, principal claim-holder of [ECO-Minerals-Stockpile...](http://ECO-Minerals-Stockpile.com)

2)What? Feldspathic “Nepheline Syenite” is described by Google searching Wikipedia, and DuckDuckGo where position 4 explains 3M’s use of nepheline in their products, and position 16 (at the moment) on DuckDuckGo for “Oregon’s Unique CLC Concrete Building Material” published © 2015, which really needs an update. All that has happened to slow us down, momentarily, by a North American multinational oligarchy competition, exposed as a Great American Way traitor for refusing closing down one of their operating Russian Nepheline Syenite mills —fortunately forced us to defend our science by publishing in www.MiningInvestment.com, and www.ECO-GoGreen-Magazine.com, which is running the academic white papers of “How a Naturally Formed Nepheline Syenite Alumina Silicate...High Performance Geopolymer ‘Paste’ Is Being Left Behind...” and “The Scientific Way to Deal With Climate Change... Includes Nepheline”...

3)Why? ECO-Mining-Milling Limited Cooperative Association is bending over backward to protect our individual “working member investors” and “patron investors” buying-in by supplying the sophisticated mining machinery, needed for ECO operations that will produce a valid 10% ROI. This, to escape the trauma of being bossed about by someone who thinks “his funding” direction should be trading paper leveraged hedge fund paper, or electronic credits, instead of delivering a ready to sell a very much needed at this time, retail product by a “single independent dealer” or a national distribution system, as...

4)Where? The “ECO-flow-through system” started with a do-it-yourself, \$30 per in-place [FoamKrete™](http://FoamKrete.com) ton which is basically a pure 270-M Nepheline Syenite (selling in China for \$200- 250 per FOB ton, and up to high of \$4,000 per milled ton in the USA) which was initially marketed as a do-it-yourself (dealer/distributor) Portland cement additive. Following that the came Sharon Ehlman’s artistic www.ECO-Roman-Cement.com opportunity which is delivered with a measured (hopefully an LCA processed) activator aggregate. The other choice on this form is a market manager for the raw, in-place Nepheline Syenite when it is milled for delivery where our target is to affordable housing at less cost than other traditional materials — as stick built which don’t do very well resisting forest fires, hurricanes, floods, earthquakes, tornadoes— is Lucas Ponce de León’s ECO-Geopolymer-Concrete.com, designed with two, or more, additional activator aggregates that would work well with nanotube reinforcement, to exceed the standards required to replace aging Eisenhower freeway bridges....

5) How? Which really is a blunt, “What’s in it for ME”! The ridiculously low \$30 per in-place ton (as found on potential common variety gravel quarries) entry is actually how an 83-year “[TheProspector](http://TheProspector.com)” wants to exit stage left —thanks to a continuing royalty of 2.5% on every ton sold, and my participating in a Limited Cooperative Association 10% return paid upon delivery after the milling. Royalties in the mining business (and sometime used for financing films) are quit legal, and do offer protection from a pump and dump scheme by being a lien on the property, preventing a quick flipping, or shorting. The ME part for You as an independent investor owning an in-place ton (more or less in a natural vault (see our www.MiningInvestment.com) by contract you will also have a royalty of 2.5% on every ton that passes through (not legally required) for www.ECO-Mining-Milling.com processing, secured by a equal \$30 down payment on an open end contract. Your paid for ton may be held in the vault for sale on www.MinersExchange.com, or leveraging with your chosen marketing association, when the \$30 entry price goes up after “proof of concept” homes attracts national publicity, as Russian 3D printed home in Texas and New Jersey have experienced.

6) When? YOUR 2.5% Royalty — if you have made another \$30 per ton down payment for processing in-line with Your Bill of Sale Certificate number, can be collected as an accumulated product value with a wholesale price just under (hopefully) the median North American value for mined and milled Nepheline Syenite.

Besides yours, and my 2.5% ton-owners royalties coming out on the top of the ECO-Mining-Milling.com 10% production royalty I have added a 2.5% royalty to help out the end use start-up as a [FoamKrete™](http://FoamKrete.com) Dealer’s Distributorship (no, not a franchise); or a promotion by doing something very artistic with an unreinforced ECO-Roman-Cement.com; by Sharon Ehlman; or Lucas Ponce de León’s ECO-Geopolymer-Concrete.com. And —just doing the right thing—another 2.5% royalty for, tithing to support and promote affordable housing. Add the ECO-Mining-Milling 10% profit paid, to the specific 2.5% royalties to what is delivered from the Lincoln County mill, the total is 20% of the all costs, and royalties paid subtracted from competitive wholesale price. As the Hearst fortune was built upon a 2.5% royalty from the development of Homestake gold mining we do not know the delivered production ton total will be, but play with the lowest mill price of **your 2.5% of \$250? as additional interest** when selling your ton. Want to be a LCA shared 10% double dipper, then take a look at the upfront options, following.
